Question ID : 5861802563

Comprehension:

Read the following passage and answer the questions that follow.

The rise of the Internet has sparked a debate about how online communication affects social relationships. The Internet frees us from geographic fetters and brings us together in topic-based communities that are not tied down to any specific place. Ours is a networked, globalised society connected by new technologies. The Internet is the tool we use to interact with one another, and accordingly poses new challenges to privacy and security.

Information technologies have wrought fundamental change throughout society, driving it forward from the industrial age to the networked era. The Internet has changed business,

education, government, healthcare, and even the ways in which we interact with our loved ones – it has become one of the key drivers of social evolution.

The changes in social communication are of particular significance. Although analogue tools still have their place in some sectors, new technologies are continuing to gain ground every day, transforming our communication practices and possibilities – particularly among younger people. The Internet has removed all communication barriers. Online, the conventional constraints of space and time disappear and there is a dizzyingly wide range of communicative possibilities. The impact of social media applications has triggered discussion of the “new communication democracy.”

The development of the Internet today is being shaped predominantly by instant, mobile communications. Mobile Internet is a fresh revolution. Comprehensive Internet connectivity via smartphones and tablets is leading to an increasingly mobile reality: we are not tied to any single specific device, and everything is in the cloud.

People no longer spend hours gazing at a computer screen after work or class; instead, they use their mobile devices to stay online everywhere, all the time.

Question ID : 5861802578

Comprehension:

Read the following passage and answer the questions that follow.

The House Sparrow and its subspecies are worldwide in their distribution, except in the polar regions. Sparrows have had a symbiotic relationship with humans for the past 10,000 years. But strangely, over the past 50-60 years, sparrows have been sadly deserting human company in urban areas, preferring suburban areas and the countryside, and only making brief visits to nearby human habitats.

Sparrows, though tiny, are very sensitive and strongly immune birds, and their sudden disappearance as sentinels or as ecological indicators is a warning to humans about impending environmental hazards. The rapid changes in the lifestyles of humans in urban areas are increasingly incompatible with the conservative lifestyles of sparrows.

Non-availability of tiny insects as food due to the loss of vegetation around our modern buildings, the excessive use of mosquito repellents indoors and insecticides outdoors, our concrete architectures with no nesting sites for sparrows, and air-conditioning which leaves no entry or exit points for feeding sparrow nestlings are some of the reasons for the dislocation of sparrows. Further, increasing noise from automobiles and their gaseous pollutants in our cities may be deterrents. Above all, the recent increase in electromagnetic radiations from cell phone towers outdoors and the explosive use of diverse wireless devices indoors have also chased away the birds. It could be the synergistic effect of all these environmental pollutants that has compelled sparrows to fly away from their long-trusted human companions.
