Read the following passage and answer the questions below.

Recession surfaces when the economy is not able to reach its full potential, which leads to the recessionary gap. It measures the difference between where the economy is and where the economy should be. The ideal situation will prevail when the economy is in long-run equilibrium where all the resources are utilized to their maximum and most efficient capacity. It should be kept in mind that the ideal economy does not mean zero unemployment, no inflation, and factories running twenty-four hours seven days a week. In such a situation, the natural unemployment rate shall be there which includes individuals who are unemployed because they are in transition. Also, the factories will have their downtime for maintenance and up-gradation.

This is pointed out that the economy is operating below the full-employment level thereby leading to a downfall of the general price level in the long term. It comes into the forefront during the times of economic downturn and is related to higher unemployment numbers.

Although it implies an economic downturn it can remain stable suggesting short-term economic equilibrium below the ideal, which may be as damaging to an economy as an unstable period. This happens because long periods of lower GDP production inhibit growth and is the main contributor to sustained higher unemployment levels. Since production levels change to compensate it, the prices also change.

This is a sign that the economy is moving into a recession and may lead to unfavorable exchange rates for foreign currencies. When the exchange rate for foreign currencies is affected it also affects the financial returns on the exported goods. The lower return on exported goods contributes less towards the exporting countries' GDP and further acts as a catalyst to the recessionary trend.
